## About this document

This document describes the main new functionality in the Webforum 16.2 release.

If you are interested in getting access to functionality that you currently do not have, please contact Webforum or a Webforum partner.

# Overview

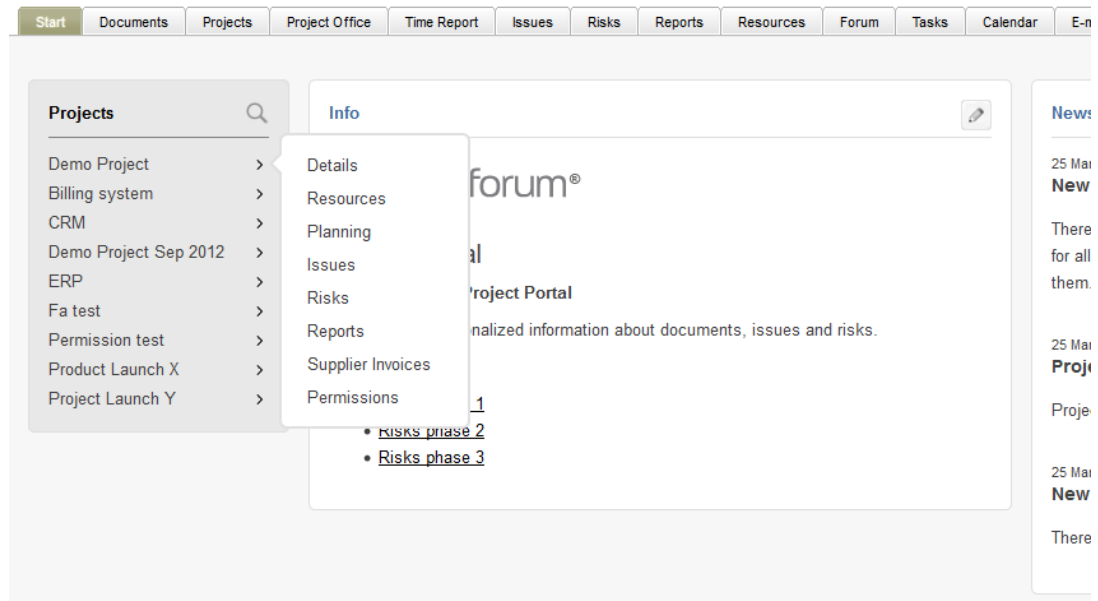

The following functionality is new:

<b>Module/Function</b>	<b>Description of changes</b>
<b>Start page</b>	New project list
<b>Documents</b>	Support for Microsoft Office Online
	Import metadata using DWG files
	Document attribute in activity report
	New document dialog
<b>Projects</b>	New project chooser
	Documents tab under projects
<b>Issues</b>	Show issue types in separate lists
	Sort by issue name in the issue list
	Improved subject of issue notification emails
	Numeric pick lists

# Start page / Dashboard

## ***New project list***

Workspaces with projects now have a project list on the left hand side of the start page. The project list shows the user's latest visited projects. It is possible to search for other projects from the list. A menu lets the user navigate directly to the project modules.

# Documents

## ***Support for Microsoft Office Online***

Users that have a Microsoft Office 365 Business account can now edit Office documents with Microsoft Office Online. With Office Online it's possible to edit Word, Excel, and PowerPoint files in the web browser. No program or plugin installation is required.

The Office Online functionality needs to be turned on for the workspace. Please contact Webforum or your Webforum reseller if you are interested.

## ***Import metadata using DWG files***

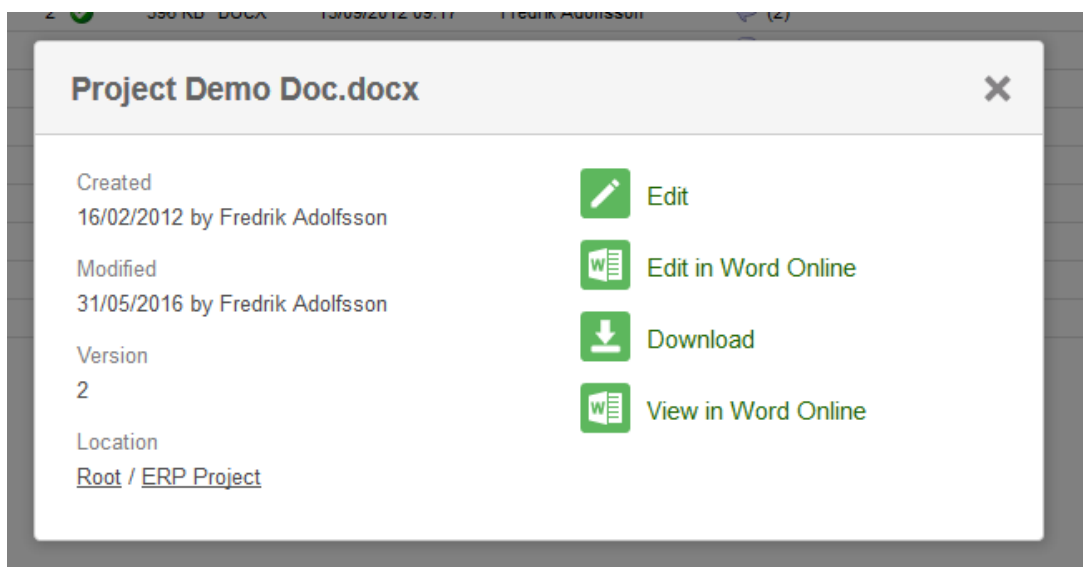

As an option it is now possible to import metadata to your documents using DWG files instead of an Excel file. One DWG file should be uploaded for each document file that is imported.

## ***Document attribute in activity report***

It is now possible to select a document attribute to be included in the activity report.

## ***New document dialog***

The dialog that is opened when you click on a document has had a face lift.

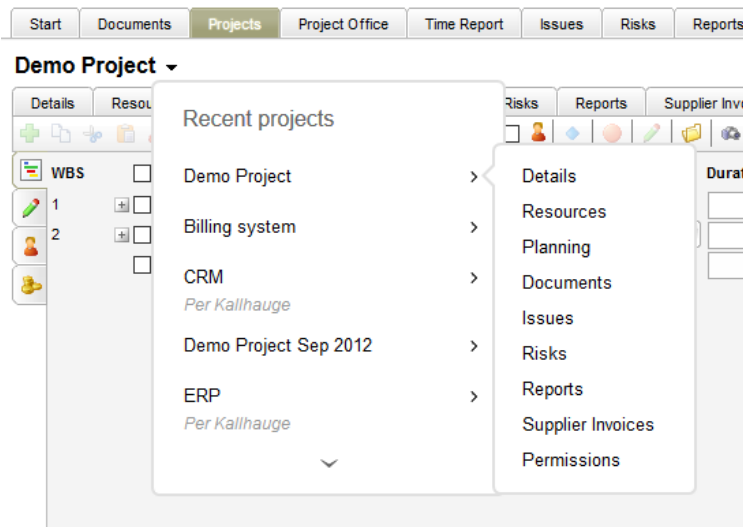

## ***Other***

It is no longer possible to create more than one alias per folder to a document.

# Projects

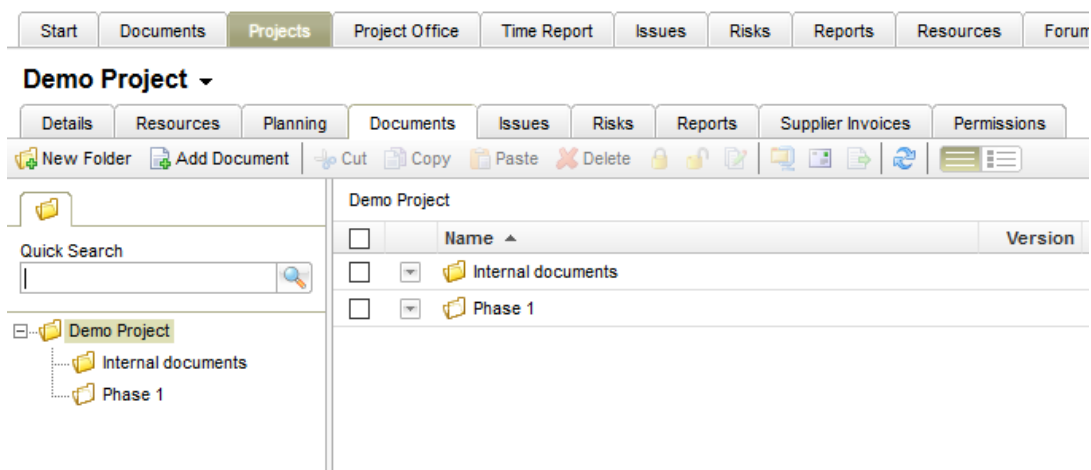

## ***New project chooser***

It's now possible to quickly switch to another project by clicking on the small arrow icon after the project name. This displays a list of the most recent projects that the user has visited. A menu allows for direct navigation to the project modules.

## ***Documents tab under projects***

The project folder is now displayed under a new project tab "Documents". The new project document archive is a limited version of the workspace level document archive module. The project folders are still displayed on the workspace level and the same permissions apply for access to the documents in the project folder.

# Issues

## **Show issue types in separate lists**

It is now possible to separate issues of different issue types into their own tabs under projects. The new tabs work just like the project level issue module but show only issues of one issue type. Issue types that are not specified to be shown separately will be shown under the Issues tab. All issues are shown on the workspace level just as before.

*Issue type in a separate tab (“Requests” in this example)*

## **Sort by issue name in the issue list**

It is now possible to sort the issue list by name.

## **Improved subject of issue notification emails**

The issue notification emails now include the issue number.

## **Numeric pick lists**

It is possible to specify that a pick list can only contain numeric values. Such pick lists can be used in calculated fields.
