	Improvements to the create project process
	Possibility for project administrators to update settings
<b>API</b>	New functionality in the Webforum API
<b>Other</b>	Login via SAML 2.0 or with Webforum account possible
	Workspace deletion from Admin

# Documents

## ***Quick lists available in the project level document archives***

The quick lists are now available in the project level document archives.

## ***See other users' annotations on drawings***

It is now possible to see other users' annotations in the Rasterex viewer, not just your own.

## ***Rasterex as document viewer for drawings in the mobile interface***

Rasterex is now used as document viewer for drawings the mobile interface. It has the same functionality there as in the standard desktop interface.

# Projects

## ***Access to project modules without access to the details tab***

It is now possible to give users access to project modules without also giving them access to the project's details tab. This means that information on the project's details tab will be shown to users who don't have permission to this tab. To protect sensitive information a new setting "Show in project list" has been added for flexible project fields. When this setting is off the field is hidden in the project list under the Projects tab. The fields are still shown in the project office.

## ***All template projects available for users with permission to create new projects***

All template projects are now available to use for users with permission to create new projects. These users no longer need permission to see the template project in the project list.

## ***Improvements to the create project process***

A possibility to select a project manager when a new project is created has been introduced. The user that is selected as project manager is given Full permission in the project and on the project folder. The user that creates the project is now only added with its own permission on the project if they are not a project administrator.

The user selected as project manager is also added as a resource in the project.

When a new project is created from a template the following improvements have been made:

1. All permissions for groups on folders and documents in the project folder are copied
2. The permissions that were set for the templates project group are transferred to the new project's project group
3. The user creating the new project does not need permission to see all folders and documents for these to be copied
4. A number of options have been removed from the process to make it easier to understand

## ***Possibility for project administrators to update settings***

Project administrators can update project settings under Admin without needing workspace administrator permissions.

## API

### ***New functionality in the Webforum API***

New functionality has been added to the Webforum API. Contact us for more information.

## Other

### ***Login via SAML 2.0 or with Webforum account possible***

Customers that have connected their own identity provider to handle their users' logins can now combine this with normal Webforum login. Contact us for more information.

### ***Workspace deletion from Admin***

It is now possible to allow administrators to delete the current workspace. This feature has been added for customers with many workspaces. Contact us to have this turned on.
